Research Fields

Primary: Macroeconomics, Heterogeneous Agents, Monetary Policy

Secondary: Welfare Assessments, Housing, Fiscal Policy

Education

Ph.D. in Economics , Toulouse School of Economics	2021 – 2027 (expected)
M.Res. in Economics , Toulouse School of Economics	2022 – 2023
M.Sc. in Economic Theory and Econometrics , Toulouse School of Economics	2020 – 2022
B.Sc. in Mathematics and Economics , Toulouse School of Economics	2017 – 2020

Research Positions

PhD Traineeship, European Central Bank <i>Monetary Policy Research, Directorate General Research</i>	Oct 2025 – Sep 2026
Summer Graduate Research Program, Banco de México <i>Directorate General of Economic Research</i>	Jun 2025 – Aug 2025

Job Market Paper

Rent Inflation and Monetary Policy

with Gonzalo Paz-Pardo (2026)

Rental prices enter the inflation indices that central banks target, yet rents behave unlike other consumer prices after a monetary policy shock. We build a Heterogeneous-Agent New Keynesian model where households rent, own, or become landlords, with endogenous house prices and rents, and sticky leases. A monetary tightening keeps would-be buyers renting, and rents rise until enough owners supply the extra rental housing. About three-quarters of the effect on the rental market is supply-driven: higher financial returns and mortgage costs make supplying rental housing less attractive. We study how policy should treat rent inflation. A Taylor rule based on a price index that incorporates rents generates more consumption and inflation volatility than one which ignores rents. The welfare-optimal weight on rent inflation is negative under both general demand and rental supply shocks: central banks should react to rental increases with accommodative policy.

Working Papers

Intergenerational Welfare Assessments

with Eduardo Dávila and Andreas Schaab (2026), NBER Working Paper

This paper studies welfare assessments in economies with rich demographics. We introduce the notion of demographically disconnected economies, those with no date at which all individuals are

concurrently alive. We identify the unique class of units that always enables meaningful welfare comparisons in such economies: those based on perpetual consumption, that is, consumption at all dates. Using these units, we uncover a novel possibility: feasible perturbations of Pareto efficient allocations can yield Kaldor–Hicks efficiency gains. We also introduce a decomposition that attributes intertemporal-sharing efficiency gains to financial frictions or demographic differences. These results allow us to derive new insights in three workhorse intergenerational models: (i) Samuelson (1958) two-date-life model, offering a novel rationale for social security; (ii) Diamond (1965) growth model, providing a new theory for capital taxation and capital over-/under-accumulation; and (iii) Samuelson (1958) three-date-life model, decomposing the efficiency gains from intergenerational transfers into frictional and demographic sources.

Work in Progress

Ramsey Optimal Policy in Production Networks with Menu Costs

with Mishel Ghassibe, Anton Nakov and Dominik Thaler (2026)

We study optimal monetary policy in a production network subject to large sectoral shocks, such as a sharp increase in energy prices. With menu costs, firms choose when to adjust prices, so large shocks change the sectoral characteristics that guide inflation stabilization in linearized models. We solve the fully nonlinear Ramsey problem to determine which sectors the central bank should stabilize and when accommodating full price adjustment in one sector is preferable to stabilizing an inflation index.

Optimal Public Debt Adjustment with Heterogeneous Agents: the Role of Aggregate Risk (2025)

What is the role of aggregate risk in determining how fast a government should repay the excess public debt contracted during a recession? I study optimal fiscal adjustment in a heterogeneous-agent model with capital and aggregate shocks. High public debt crowds out capital and depresses wages, with severe consequences for hand-to-mouth households. It also raises interest rates, creating a trade-off between capital gains and a redistributive motive. Both effects are stronger in recessions, which is where aggregate risk matters. Numerically, the welfare-maximizing path of debt adjustment is consistent with the one observed in the US, and it departs from tax smoothing because of household heterogeneity and uncertainty about the future.

Presentations

2026: ECB Early Ideas Seminar, TSE Macro Workshop

2025: Bank of Mexico Seminar, TSE Macro Workshop

2024: Simposio de la Asociación Española de Economía (SAEe) 2024, TSE–Bank of Mauritius Workshop, TSE Macro Workshop

Teaching Experience

Teaching Assistant, Toulouse School of Economics

- Macroeconomics (1st year Ph.D.)

Winter 2025

- Macroeconomics (Master)

Fall 2024

- Public Economics (Master) Winter 2024-2025
- Macroeconomics 2 (Bachelor) Winter 2023-2024
- Macroeconomics 3 (Bachelor) Fall 2023

Summer Schools

Princeton Initiative: Macro, Money and Finance <i>with Markus Brunnermeier and Yuliy Sannikov</i>	Summer 2023 <i>Princeton</i>
Heterogeneous-Agent Macro Workshop <i>with Adrien Auclert, Bence Bardóczy, Matthew Rognlie and Ludwig Straub</i>	Spring 2023 <i>NBER, Cambridge</i>
Advanced Numerical Methods in Macroeconomics <i>with Jesús Fernández-Villaverde and Galo Nuño</i>	Summer 2022 <i>CEMFI, Madrid</i>

Awards and Scholarships

Doctoral Fellowship, French Ministry of Higher Education and Research	2022 – 2026
TSE Scholarship	2021 – 2022

Other Research Activities

Organizer, TSE Macro Workshop

Collaborator, DS-weights repository on GitHub (toolbox to compute welfare assessments), with Eduardo Dávila and Andreas Schaab

Other

Languages: Catalan (native), Spanish (native), English (fluent), French (fluent)
